

Laravel Request Lifecycle - Simple Overview

**Ever wondered what actually
happens after a user hits a
Laravel route?**

**Understanding the Laravel
Request Lifecycle helps you
debug faster, write cleaner
code, and understand the
framework deeply.**

usmaniqbal.dev

Here's the simplified flow

1. User sends a request

A request enters Laravel through `public/index.php`.

2. Composer autoloading

Laravel loads all required classes.

3. Bootstrap process starts

The application instance is created.

4. HTTP Kernel handles the request

Bootstraps important services and middleware.

Examples of middleware:

- Authentication
- Rate limiting
- CORS
- Request logging

5. Route matching

Laravel matches the URL with the correct route.

6. Controller execution

The matched controller method runs business logic.

7. Response generation

Laravel prepares: Blade view, JSON, redirect, or file download.

8. Response sent to browser

Final response returned to user.

9. Termination phase

Cleanup tasks after the response.

Why is this important?

Because middleware, service container, providers, and queues all depend on it.
