

☐ Laravel Request Lifecycle — Simple Overview

Ever wondered what actually happens after a user hits a Laravel route?

Understanding the Laravel Request Lifecycle helps you debug faster, write cleaner code, and understand the framework deeply.

Here's the simplified flow ☐☐

- 1☐ User sends a request — A request enters Laravel through public/index.php.
- 2☐ Composer autoloading — Laravel loads all required classes using Composer.
- 3☐ Bootstrap process starts — The application instance is created from bootstrap/app.php.
- 4☐ HTTP Kernel handles the request — bootstraps important services and middleware.
- 5☐ Middleware execution — Global and route middleware run before the request reaches the controller.

Examples of middleware:

- Authentication
- Rate limiting
- CORS
- Request logging

6□ Route matching — Laravel matches the URL with the correct route.

7□ Controller / Closure execution — Business logic runs.

8□ Response generation — Blade view, JSON, redirect, or download.

9□ Response sent to browser.

□□ Termination phase — Cleanup tasks after the response is sent.
